

Module 1 - Front-End Web Development

JavaScript – DOM Manipulation

MobiWash Online Booking System - Login Module Requirements

Overview

MobiWash, a mobile car wash business, is developing an online booking system to expand their operations. The company currently has a web developer with CSS expertise, and you have been recruited as a JavaScript developer to implement the login functionality.

Current Implementation Status:

- The HTML structure for the login page is complete
- CSS styling for the login form and modal is implemented
- Basic navigation structure is in place
- No JavaScript functionality has been implemented yet

Technical Requirements:

Login Form Implementation

1. Create form validation for the login system that:
 - Prevents the default form submission behaviour
 - Validates user credentials
 - Displays appropriate feedback for incorrect login attempts

User Interface Requirements

1. Modal Management:
 - Implement functionality to show/hide the error modal
 - Modal should be hidden by default when page loads
 - Modal should display when login credentials are incorrect
2. Navigation Toggle:
 - Implement sidebar toggle functionality
 - Toggle button should rotate 90 degrees when sidebar is expanded
 - Sidebar width should adjust between 50px (closed) and 272px (open)
 - Links should fade in/out based on sidebar state

Authentication Requirements:

1. Basic Authentication
 - Implement credential verification
 - Redirect to index.html upon successful login
 - Display error modal for incorrect credentials

Success Criteria:

- Users can attempt to log in using the login form

- Invalid login attempts trigger an error modal
- Successful login redirects to the main application
- Sidebar navigation can be toggled open and closed
- All animations and transitions work smoothly

Technical Constraints

Your implementation must maintain existing CSS styling and class names and must integrate with existing HTML structure

Deliverables:

A JavaScript file containing the following:

- Login form validation logic
- Modal management functions
- Navigation toggle functionality
- Authentication handling
- Well documented/commented code base

Submission

Save your code in a JavaScript file named file named **main.js** and upload it to the LMS along with all the resources you were given, including the HTML, CSS and media files. Ensure that you adhere to the correct folder structure and hierarchy. Demonstrate your completed website to your instructor.
